

ABSTRACT

A receptacle for receiving an electrical plug is disclosed. The receptacle includes a plurality of channels which extend generally for the length of the receptacle. The channels include conductors where at least one of the conductors accommodates the smaller prong on a polarized plug. At least one of the conductors is in a constant "hot" state while at least one conductor is controlled by a switch. A receptacle of the invention is normally adapted to baseboards to allow a user to insert an electrical plug in either a constant "hot" connection or a switched controlled connection for generally the length of the baseboard.
